

Adhesive Tooth Replacement

Petr Barták, M.D.

Practically every day, the dentist encounters the need to replace individual missing teeth in his patients. Doctor has several options to choose from, some of which are considered standard and proven, others are classified by the scientific community as alternative and marginal procedures. When choosing a specific solution, the doctor should make decisions based on objective criteria and should always choose a method of treatment that will be as least burdensome as possible for the patient and at the same time meet the demands for a functional and aesthetic replacement.

In his presentation, the speaker will discuss the individual options available to the dentist when replacing individual missing teeth, and the decision-making criteria for each of them. He will focus mainly on the issue of adhesive treatment, from the point of view of indication, from the point of view of material possibilities, biomechanics, fixation and solving various types of soft tissue deficits around the prosthesis. Emphasis will be placed on minimal invasiveness.
